

Teinture française

deep black

Article Code : 0812994

NEW COLOUR AVAILABLE

Description :

This is the first penetrating dye that allows you to obtain in a single coat on porous smooth leathers, vegetable tanned leather, aniline and nubuck suede, a real deep black color that is unmatched by other products currently on the market.

The differences with the former TEINTURE FRANÇAISE black renamed to the next production TEINTURE FRANÇAISE black base are :

- A deep black tint, in a single application, regardless of the color of the substrate (white, red, burgundy...).
- A uniform deep black finish, without mottling, even when applied to very porous surfaces such as light nappa leathers or nubuck suede.
- The much higher concentration of pigments has forced us to modify the solvent mixture used to solubilize them.

As a result, we have a lower penetration than the TEINTURE FRANÇAISE black base and a slightly longer drying time. This is why it is preferable to strip heavily pigmented leathers with SAPHIR stripper beforehand. Unlike the TEINTURE FRANÇAISE black base which can also be applied on plastic coated leather, leather from lower quality or patent leather, we do not recommend the use of deep black on this support because of the difference in penetration power.

The black base should therefore be recommended for patent leather in order to obtain a uniform black finish.

For finishing, as for other TEINTURE FRANÇAISE, we recommend the application of the product from the SAPHIR range adapted to the nature of the leather and the article treated, i.e.:

- For smooth leathers = Surfine cream or luxury cream in black CANADIAN black color, Universal Cream.
- For nubuck suede = RENOVETINE black color (with nubuck brush).

Instructions for use :

Preparation: On smooth leather, strip with DECAPANT SAPHIR (Réf.0844).

Application:

1. After stripping, and in order to check the porosity of the leather, it is advisable to wet the leather generously to see if the water penetrates.
2. In general, it is easy to see with the naked eye whether the pores of the skin are open or completely closed.
3. Take the glove and with the help of the swab, spread the TEINTURE FRANÇAISE.
4. Repeat the operation if necessary to obtain a covering and homogeneous tint
5. Dry for 1 hour

Size and capacity :

Capacity: PET bottle labelled - 50 ml

Jar size: Diameter 45 mm, height 70 mm
